AQUA-AEROBIC SOLUTION
CLOTH MEDIA FILTRATION UTILIZING OptiFiber® PILE CLOTH MEDIA

PILE CLOTH MEDIA FILTRATION REMOVES 97% OF MICROPLASTICS FROM WASTEWATER

The Challenge

Plastics are ubiquitous. Automobiles, shopping bags, beauty products, clothing, drinking straws, computers, packing material, tools and toys all contain plastic. When we discard, clean and manufacture these items, we generate microplastics.

Microplastics are fragments of any type of plastic less than 5 mm in length, according to the U.S. National Oceanic and Atmospheric Administration and the European Chemicals Agency. They exist as beads, resin, fibers and fragments. "Microbeads" are small particles used in personal care products and the pellets used to produce plastic goods (Gregory 1996, Fendall and Sewell 2009, Cole et al. 2011). "Fragments" result from the breakdown of larger plastics, and "fibers" can slough off of synthetic textiles as we launder them. These small particles can pass through a typical wastewater treatment plant and end up in our oceans, rivers and lakes (Fendall and Sewell 2009, Browne et al. 2011).

It has been reported that roughly 8 million metric tons of plastic enter the ocean each year, and the United States is one of the top contributors to plastic pollution. Found on beaches, floating on the surface, and embedded in the sea floor, microplastics accumulate in aquatic life and subsequently in the food chain they support. Depending on the volume consumed, the type of polymer and surrounding pollutants (toxic organics and microbes can be adsorbed onto microplastics), aquatic life can be

devastatingly impacted. Research has shown that microplastics can shorten aquatic life span, reduce offspring and impact genetic expression.

The Solution

Filtering microplastics from industrial wastewater prior to discharge is one way to effectively reduce the volume of this waste material from entering our surface water. Industrial customers can rely on Aqua-Aerobic® pile cloth media filters to filter these harmful microplastics, while offering simple operation, small footprint and high forward flow to backwash ratio. The family of pile cloth media filters, available in several configurations including Aqua MiniDisk®, AquaDisk®, Aqua MegaDisk® and others, features OptiFiber® media capable of producing consistent effluent water quality.

The Proven Result

Aqua-Aerobic® pile cloth media filters used for final filtration of wastewater have proven to remove 97% of microplastics (Mintenig, Int-Veen, Loder, Primpke, & Gerdts, 2017). This study further categorized microplastics by size of the particle and isolated plastic fibers. The findings are summarized in Figure 1 below.

(Mintenig, Int-Veen, Loder, Primpke, & Gerdts, 2017)

Conclusions

Microplastics are a growing area of concern for industrial and municipal wastewater treatment plants. As microplastics accumulate in the environment, it is crucial to maximize removal at wastewater treatment plants. Adding Aqua-Aerobic Systems' pile cloth media filters is a proven technique to remove microplastics from wastewater and protect the environment.

Aqua-Aerobic® pile cloth media filters are available in a number of configurations. The exclusive OptiFiber® pile cloth media is available in a range of media from 10 micron to 2 micron and can be applied to any application. These systems offer a compact footprint, simple operation and extremely low maintenance with minimal moving parts. The recommended design will meet the hydraulic conditions, loadings and available footprint. Retrofit options can be evaluated utilizing existing basins and tanks. The most suitable technology will be optimized for the application and unique process characteristics.

AquaDisk® FILTER ADVANTAGES

- Utilizes engineered OptiFiber® cloth filtration media
- Produces consistent, reuse-quality effluent
- Backwash system fluidizes fibers for efficient release of stored solids
- Tolerates extreme variations in load
- Vertically oriented disks reduce required footprint
- Lightweight, removable disk segments for ease of maintenance
- Low backwash volume results in water savings and energy reduction
- Available in painted steel, stainless steel or concrete tanks
- Eliminates sand media and underdrains

AquaDisk® Cloth Media Filters with OptiFiber PES-14® Pile Cloth Media
